6th edition management accounting solution atkinson: *Green Accounting* Peter Bartelmus, E.K. Seifert, 2018-01-12 This title was first published in 2003. Our cherished economic indicators of income, product, consumption and capital fail in taking a long-term view of social progress. They do not account for environmental deterioration, which impairs the quality of life of present and future generations, and hence the sustainability of development. Greening the conventional national (and corporate) accounts introduces environmental impacts and costs into these accounts and balances. The result is a new compass for steering the economy towards sustainability, which may change not only our main measures of economic performance but also the basic tenets of environmental and resource policies. This book presents methodological advances and case studies of environmental accounting, and discusses their use in environmental management and policies. In their introduction, the editors provide a critical perspective of historical developments and current debates.

6th edition management accounting solution atkinson: *Cost Accounting for Shared IT Infrastructures* Reinhard Brandl, 2008-08-21 During the past few years, determining the "value of IT" has ranked high on the agenda of IT managers and Chief Information Officers (CIOs). The rather broad and abstract topic has been intensively discussed in the Information Systems literature for many years. It turns into a very tangible problem in the field of IT cost accounting. Nowadays, corporate information systems are distributed systems. A detailed measurement of resource demands of IT services on a distributed IT-infrastructure and respective accounting and cost allocation turns out to be very expensive and impractical in most cases. The large proportion of indirect costs and the difficulty of finding adequate allocation rates are a significant problem in practice, regularly leading to free-rider problems. This problem has largely been ignored in the academic literature so far. Dr. Brandl proposes a method to derive estimators for the resource demand of service requests in a distributed IT infrastructure. This estimator is based on a set of load tests and respective measurements as they are often performed during the deployment phase of new information systems. Cost allocation keys can now be determined based on the number of service invocations per user or per department and the respective estimators. While these measurements provide a lean method for the determination of usage-based cost allocation keys, it is not obvious that the estimators have sufficient accuracy, in particular concerning different types of services and volatile workloads.
