free government solar training 2023: The Rise of China's Economy Horst Löchel, Tim Jablonski, 2025-02-01 This book gives an in-depth and up-to-date insight into China's economy from a domestic as well as an international perspective. The book covers the reform trajectory and performance of China's economy since Deng Xiaoping kicked-off the reform and opening-up policy in 1978 until the current challenges and economic policies under Xi Jinping including the integration in the world economy. The analysis is based on empirical evidence and respective data. This enables the reader to take an unprejudiced look on China's political economy. The book applies fundamental economic concepts in a non-technical way to the case of China and processes the main relevant scientific and applied research to the topic. Readers gain an in-depth understanding of the second largest global economy that will shape the twenty-first century—its past, present, and future. The book is structured into three concise chapters: the reform trajectory of China's economy since 1978, the domestic and international fundamentals of China's economy today, and the long-term challenges and respective economic policies for the future. One of the key insights of the book is that China's economy and its economic model are at a critical tipping point, after a long period of successful development from a low to a middle-income country. This includes the need for a new growth model and a renewed integration into the world economy. Both challenges pose systemic risks that could seriously impede the future development of China and its economy if not carefully managed.

free government solar training 2023: Property Rights in Outer Space Matthew Johnson, 2024-05-28 This book explores the role of private mining rights in the utopian imaginary of space colonisation. It presents a transdisciplinary account of the new and evolving legislative frameworks that have been established in anticipation of commercial exploitation of the mineral resources of the off-world frontier. Written in an engaging style, the book investigates a novel case study in the history of capitalism and 'the commons': the emergence of a nascent space mining industry, undergirded by a contentious legislative framework. In 2015, the US passed laws that would recognise the claims of US corporations to own and sell space resources. This unilateral act of pre-emptive law-making would appear to contravene the terms of the UN Outer Space Treaty (1967), which declared that the exploration and use of outer space should be 'for the benefit of all mankind' and 'not subject to national appropriation'. Using this central dynamic between privately held mining rights and outer space as a 'global commons', Matthew Johnson constructs an historical sociology of space mining – from the deep historical roots of common and private property to the contemporary networks of neoliberalism that have engaged with the commercialisation of space activity. The anticipatory expansion of private property claims beyond the Earth both resonates with and problematises the 'terrain' of political history, such as the tensions between states and markets, public law and private power, 'the commons' and exclusive property. The emerging cosmopolitics of off-world private property mirrors (and is often explicitly embedded within) neoliberal geopolitics, prompting urgent questions about how we can reaffirm principles of democracy and 'common heritage' in the international laws of Earth and space. This book is compelling reading for anyone

interested in the social study of space, law, economics, technology, politics and property rights.

free government solar training 2023: The Decline Effect Dean Brooks, 2023-01-31 A crisis is coming for everyone who uses math and science. For decades now, the classical model of probability (the indifference principle and the Gaussian distribution) has been breaking down and revealing its limitations in fields from economics to epidemiology. Now a new approach has revealed the underlying non-classical principle behind all these 'anomalous' laws: — Pareto's law of elite incomes — Zipf's law of word frequencies — Lotka's law of scientific publications — Kleiber's law of metabolic rates — the Clausewitz-Dupuy law of combat friction — Moore's law of computing costs — the Wright-Henderson cost law — Weibull's law of electronics failures — the Flynn Effect in IQ scores — Benford's law of digit frequencies — Farr's law of epidemics — Hubbell's neutral theory of biodiversity — Rogers' law of innovation classes — Wilson's law of island biogeography — Smeed's law of traffic fatalities The general law behind all these particular laws (and countless others) is the decline effect. As a system ages or grows in size, the rules of probability subtly change. Entropy increases, rare items become rarer, and average performance measures decline. The human meaning of a decline may be positive (decreasing costs, falling epidemic mortality) or negative (lower customer loyalty, decreasing efficiency), but the mathematical pattern is always the same. The implications are enormous, as these examples show: All epidemic diseases decline in infectiousness and in lethality. HIV-AIDS went from a highly infectious, 95-percent fatal disease, to a survivable condition with a latency of decades. COVID-19 went from a death rate of 7 percent in early 2020, to under 2 percent in 2022. Hereditary dynasties around the world declined smoothly in lifespan, from hundreds of years to tens of years. When democracies replaced monarchies, the decline (in spans of party control) continued.
