## **Sample Network Security Questions and Answers**

Below are examples of common network security questions along with concise, informative answers that reflect the type of content found in a network security questions and answers pdf.

## **What is the CIA triad in network security?**

The CIA triad stands for Confidentiality, Integrity, and Availability. Confidentiality ensures that sensitive information is accessed only by authorized users. Integrity guarantees that data remains accurate and unaltered during storage or transmission. Availability means that network resources and data are accessible to authorized users whenever needed.

## **What is a firewall and how does it protect a network?**

A firewall is a network security device or software that monitors and controls incoming and outgoing network traffic based on predefined security rules. It acts as a barrier between trusted internal networks and untrusted external networks, blocking unauthorized access while permitting legitimate communication.

## **Explain the difference between symmetric and asymmetric encryption.**

Symmetric encryption uses the same key for both encryption and decryption, which requires secure key distribution. Asymmetric encryption uses a pair of keys: a public key for encryption and a private key for decryption, enhancing security for key exchange processes.

## **What is a VPN and why is it used?**

A Virtual Private Network (VPN) creates a secure and encrypted connection over a less secure network, such as the internet. It is used to protect data privacy and integrity when accessing remote networks, allowing users to safely connect to corporate networks or browse the internet securely.

## **List common types of network attacks.**

1. Denial of Service (DoS) Attack
2. Man-in-the-Middle (MitM) Attack
3. Phishing
4. Malware Infections
5. IP Spoofing
6. SQL Injection
7. Password Attacks
